BUSINESS REQUIREMENTS (ANONYMIZED)

SAP Cost Center Line-Item Reporting

Reference Key Visibility

Prepared by: Greg Homstad
Date: September 2025

Version 0.2.0

VERSION HISTORY			
VERSION	REVISION DATE	DESCRIPTION OF CHANGE	AUTHOR
0.1.0	09/11/2025	Initial draft prepared for business requirements gathering session with finance stakeholders.	Greg Homstad
0.2.0	9/12/2025	Updated based on stakeholder feedback. Removed solution assumptions, clarified reporting scope, aligned terminology, added negative testing scenarios, and refined language to be business-focused rather than solution-driven.	Greg Homstad

1.0 INTRODUCTION

1.1 Purpose

The purpose of this document is to enable users to easily identify the external source system of financial postings directly within the SAP cost center line-item report (KSB1). Currently, this information is only accessible by navigating into individual document headers, which is time-consuming and inefficient.

Providing direct visibility into the external source identifier will reduce reconciliation effort, improve traceability, and allow stakeholders to more efficiently reconcile SAP postings with external source systems.

2.0 PROJECT OVERVIEW

2.1 Objectives

- **Specific:** Provide visibility into external source system identifiers within the KSB1 report to support financial reconciliation.
- **Measurable:** Enable users to reconcile SAP postings without drilling into individual document headers.
- **Attainable:** Business need can be met using information already available in SAP postings.
- **Realistic:** Business needs can be met using data already present in SAP financial documents.
- **Time-bound:** Deliver reporting visibility by the end of Q4 FY2025.

2.2 Assumptions

External source identifiers are consistently populated in SAP document headers for relevant postings.
Users have the required authorization to view cost center line items and related information.

2.3 Constraints

The reporting change must not degrade report performance or user experience.
The change must remain compatible with existing SAP reporting structures.

2.4 Risks

If external source identifiers are inconsistently populated, reconciliation accuracy may be impacted.
Changes to how future external systems supply identifiers could reduce long-term reporting usefulness.

3.0 Supporting Documents

3.1 As Is

Currently, users are unable to view the external source identifier directly within the KSB1 report grid. To access this information, users must navigate through multiple SAP reporting and document display screens to view document header data.

This workflow requires repeated drill-down actions and is inefficient when reconciling large volumes of postings. The process increases reconciliation time and introduces opportunities for user error.

Current workflow summary:
1. Execute an SAP report group to access cost center reporting.
2. Select a cost center and cost element.
3. Navigate into individual line items.
4. Open the associated financial document.
5. View document header information to identify the external source system.

This process is repetitive, time-consuming, and inefficient for high-volume reconciliation activities.

3.2 To Be

Users will be able to view the external source identifier directly within the KSB1 report output without navigating into individual document headers.

With this improvement:

1. Users access the KSB1 report.
2. The report displays standard cost center line-item fields along with the external source identifier.
3. Reconciliation activities can be performed directly from the report view.

This change eliminates repetitive navigation into document headers, reduces reconciliation time for high-volume postings, and improves transparency of financial data.

Note: Screenshots and system visuals have been removed from this anonymized version.

4.0 REQUIREMENTS

4.1 Business Rules/ Requirements

BRD ID	Business Rule / Requirement
BR-001	Users must be able to view the external source identifier directly within the KSB1 cost center line-item report.
BR-002	Users must be able to identify the originating external source system for a posting without navigating into individual SAP document headers.
BR-003	The solution must support efficient reconciliation of high-volume financial postings within standard reporting workflows.
BR-004	The enhancement must improve transparency of financial posting without altering existing posting logic or data values.
BR-005	The reporting change must preserve existing reconciliation, audit, and financial review processes.
BR-006	Users must be able to distinguish postings with missing or unpopulated external source identifiers.

4.2 Functional Requirements

FR ID	Functional Requirement
FR-001	The KSB1 report must display the external source identifier as a visible field within the report output.
FR-002	The external source identifier must align with the value stored at the SAP document header level.
FR-003	The report must continue to support existing filtering, sorting, and export capabilities.
FR-004	The report must display line items regardless of whether the external source identifier is populated.

4.3 Stakeholder Requirements

Business stakeholders require direct visibility into external source system identifiers within cost center line-item reporting to:

- Efficiently reconcile financial postings
- Reduce repetitive navigation into document headers
- Identify posting sources without manual investigation
- Increase confidence in reported financial data

4.4 solution Requirements

The solution must leverage existing SAP data elements and reporting capabilities to surface the external source identifier within the KSB1 report.

No new external data sources are required.

4.5 Non-Functional Requirements

The reporting enhancement must not introduce measurable performance degradation.
Report execution time must remain consistent with current baseline behavior.
The enhancement must not disrupt existing user workflows.

4.6 Transition Requirements

The enhancement must be deployed without requiring user retraining.
Existing report variants and saved layouts must remain functional.
No data migration is required.

4.7 Usability Requirements

The external source identifier must be clearly labeled and readable within the report.
Field placement must align with existing reporting conventions.
The report must remain usable for high-volume reconciliation activities.

4.8 Performance Requirements

The addition of the external source identifier must not increase report execution time beyond acceptable thresholds
The report must continue to support high-volume data sets without degradation.

4.9 Supportability Requirements

The solution must be supportable using existing SAP support processes.
No new monitoring or support tooling is required.
Errors or inconsistencies in source identifiers must be traceable through existing support workflows.

4.10 Security Requirements

Access to the external source identifier must respect existing SAP authorization roles.
Users without authorization to view cost center line items must not gain access through this enhancement.

4.11 Interface Requirements

The improvement must remain compatible with downstream reporting, exports, and integrations
No changes to inbound or outbound interfaces are required.

4.12 Compliance Requirements

The solution must comply with existing financial reporting and audit requirements.
The enhancement must not expose restricted or sensitive data beyond authorized users.

5.0 SUPPLEMENTAL DOCUMENTS

5.1 Traceability Matrix

Business Requirement	Functional Requirement	Priority	Test Case ID	Test Case Description
BR-001	FR-001	High	TC-001	Verify the external source identifier is visible in the KSB1 report.
BR-002	FR-001	High	TC-002	Verify users can identify posting source without navigating to document headers.
BR-003	FR-003	High	TC-003	Verify filtering, sorting, and export functions remain unchanged.
BR-004	FR-002	Medium	TC-004	Verify no posting values or accounting logic are altered.
BR-005	FR-003	Medium	TC-005	Verify reconciliation and audit workflows remain intact.
BR-006	FR-004	High	TC-006	Verify report behavior when external source identifier is missing or unpopulated.

APPENDIX A: REFERENCES

Document Name	Description
Requirements Gathering Session	Internal meeting notes (anonymized)
Business Stakeholder Approval	Approval record (anonymized)

APPENDIX B: KEY TERMS

Term	Definition

KSB1	SAP transaction used to display cost center line-item postings.
External Source Identifier	Identifier stored at the document header level indicating the originating external system for a financial posting.
